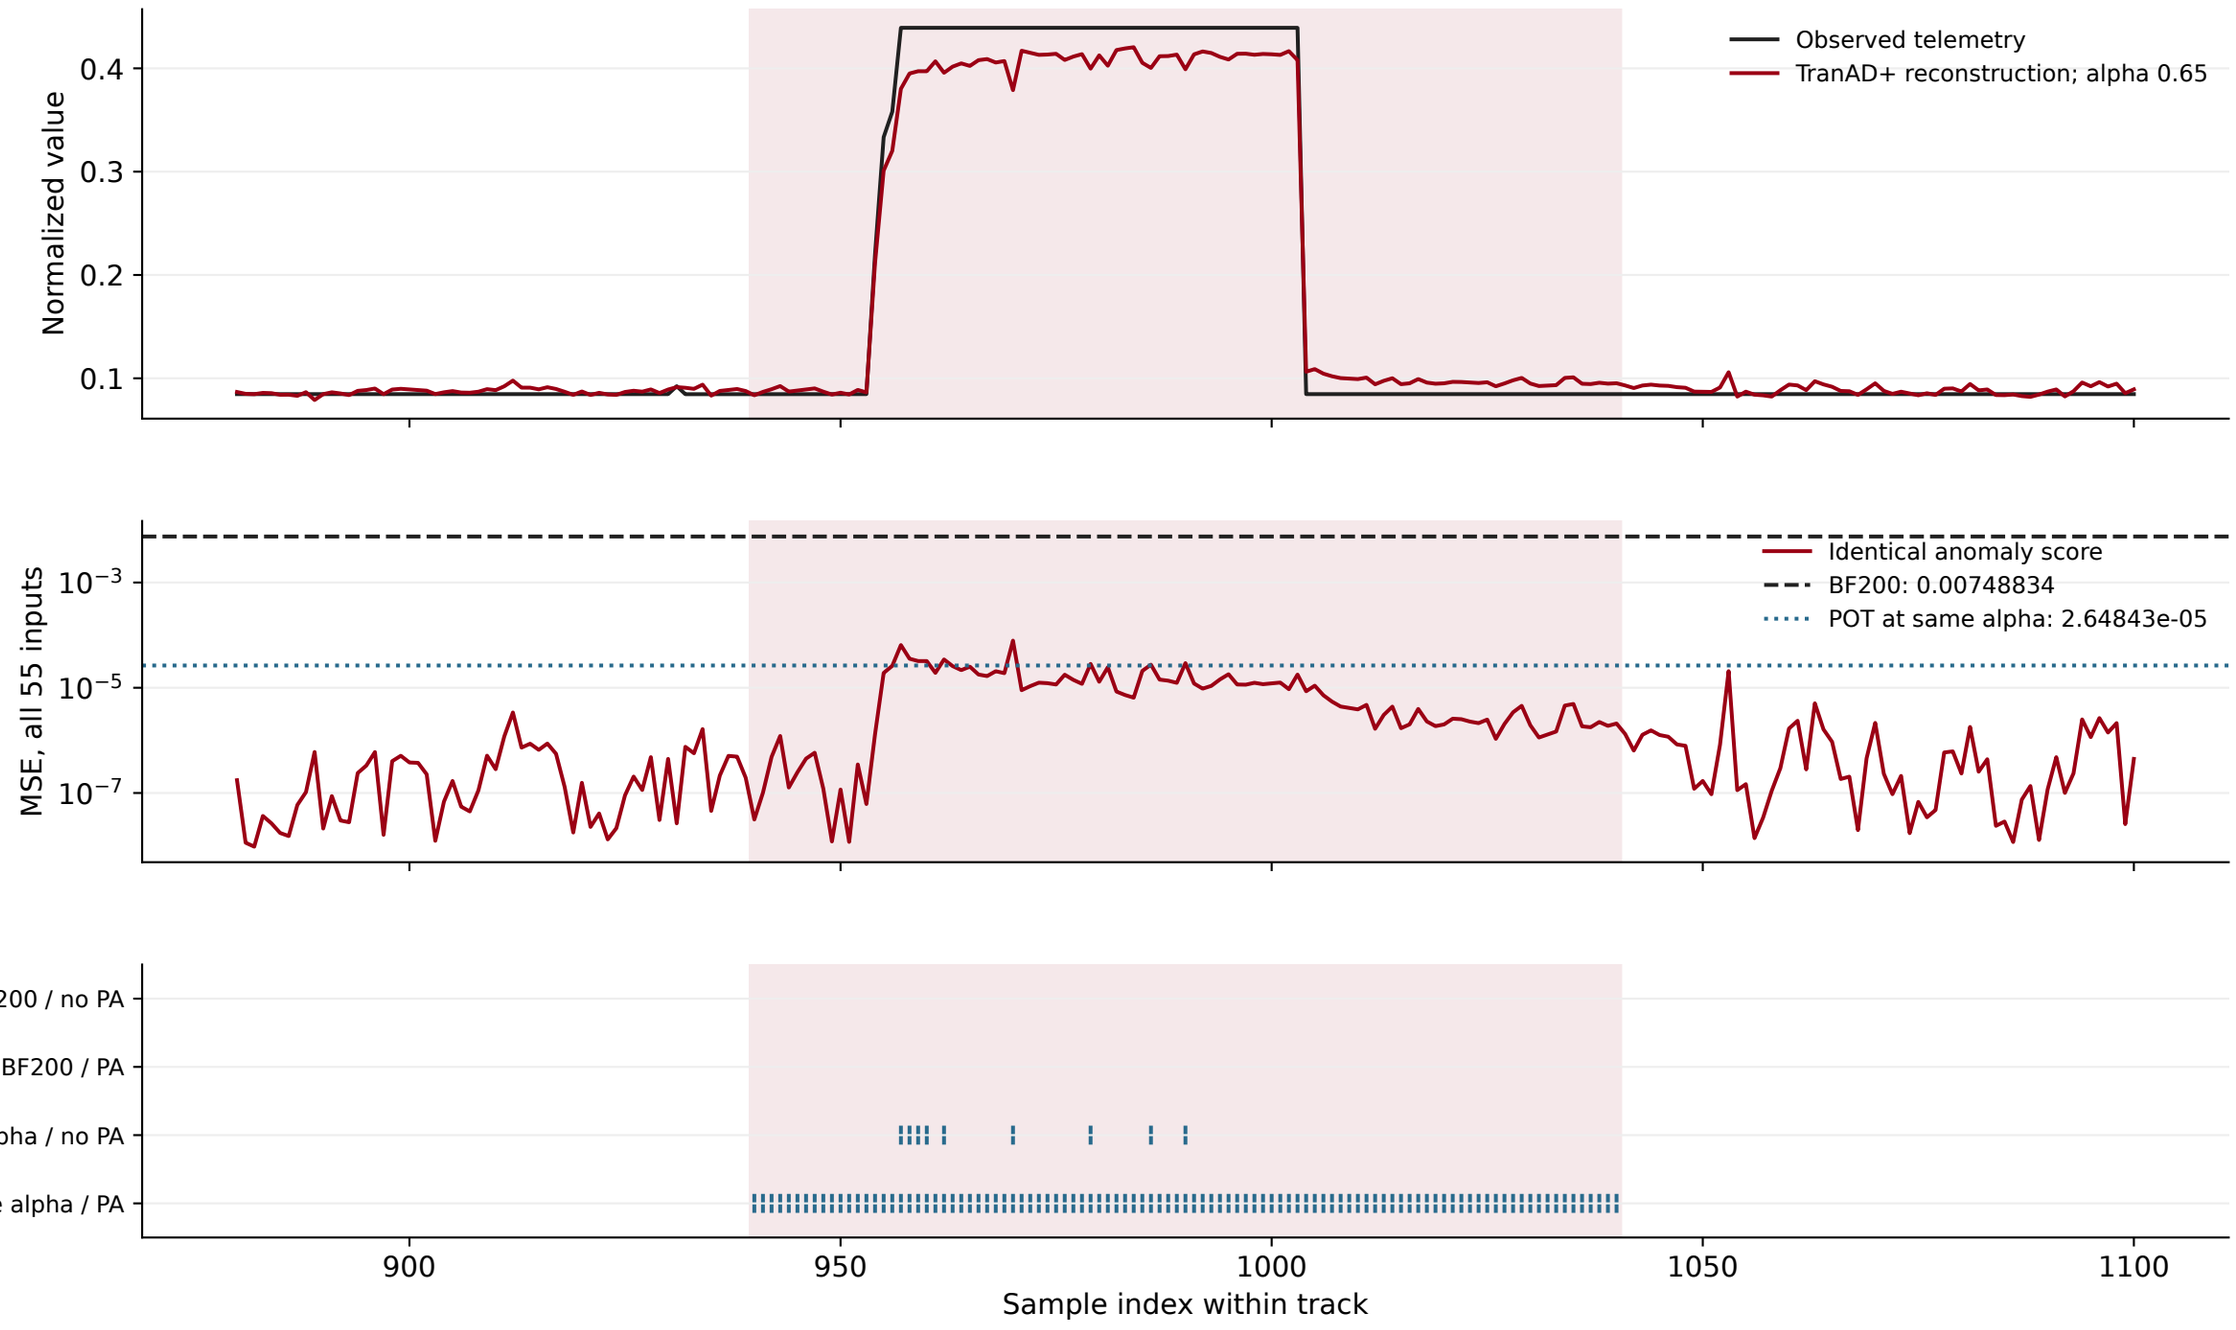
MSL / M-7: same model, same alpha, same score

Only the threshold changes. This control does not retrain or optimize another alpha.

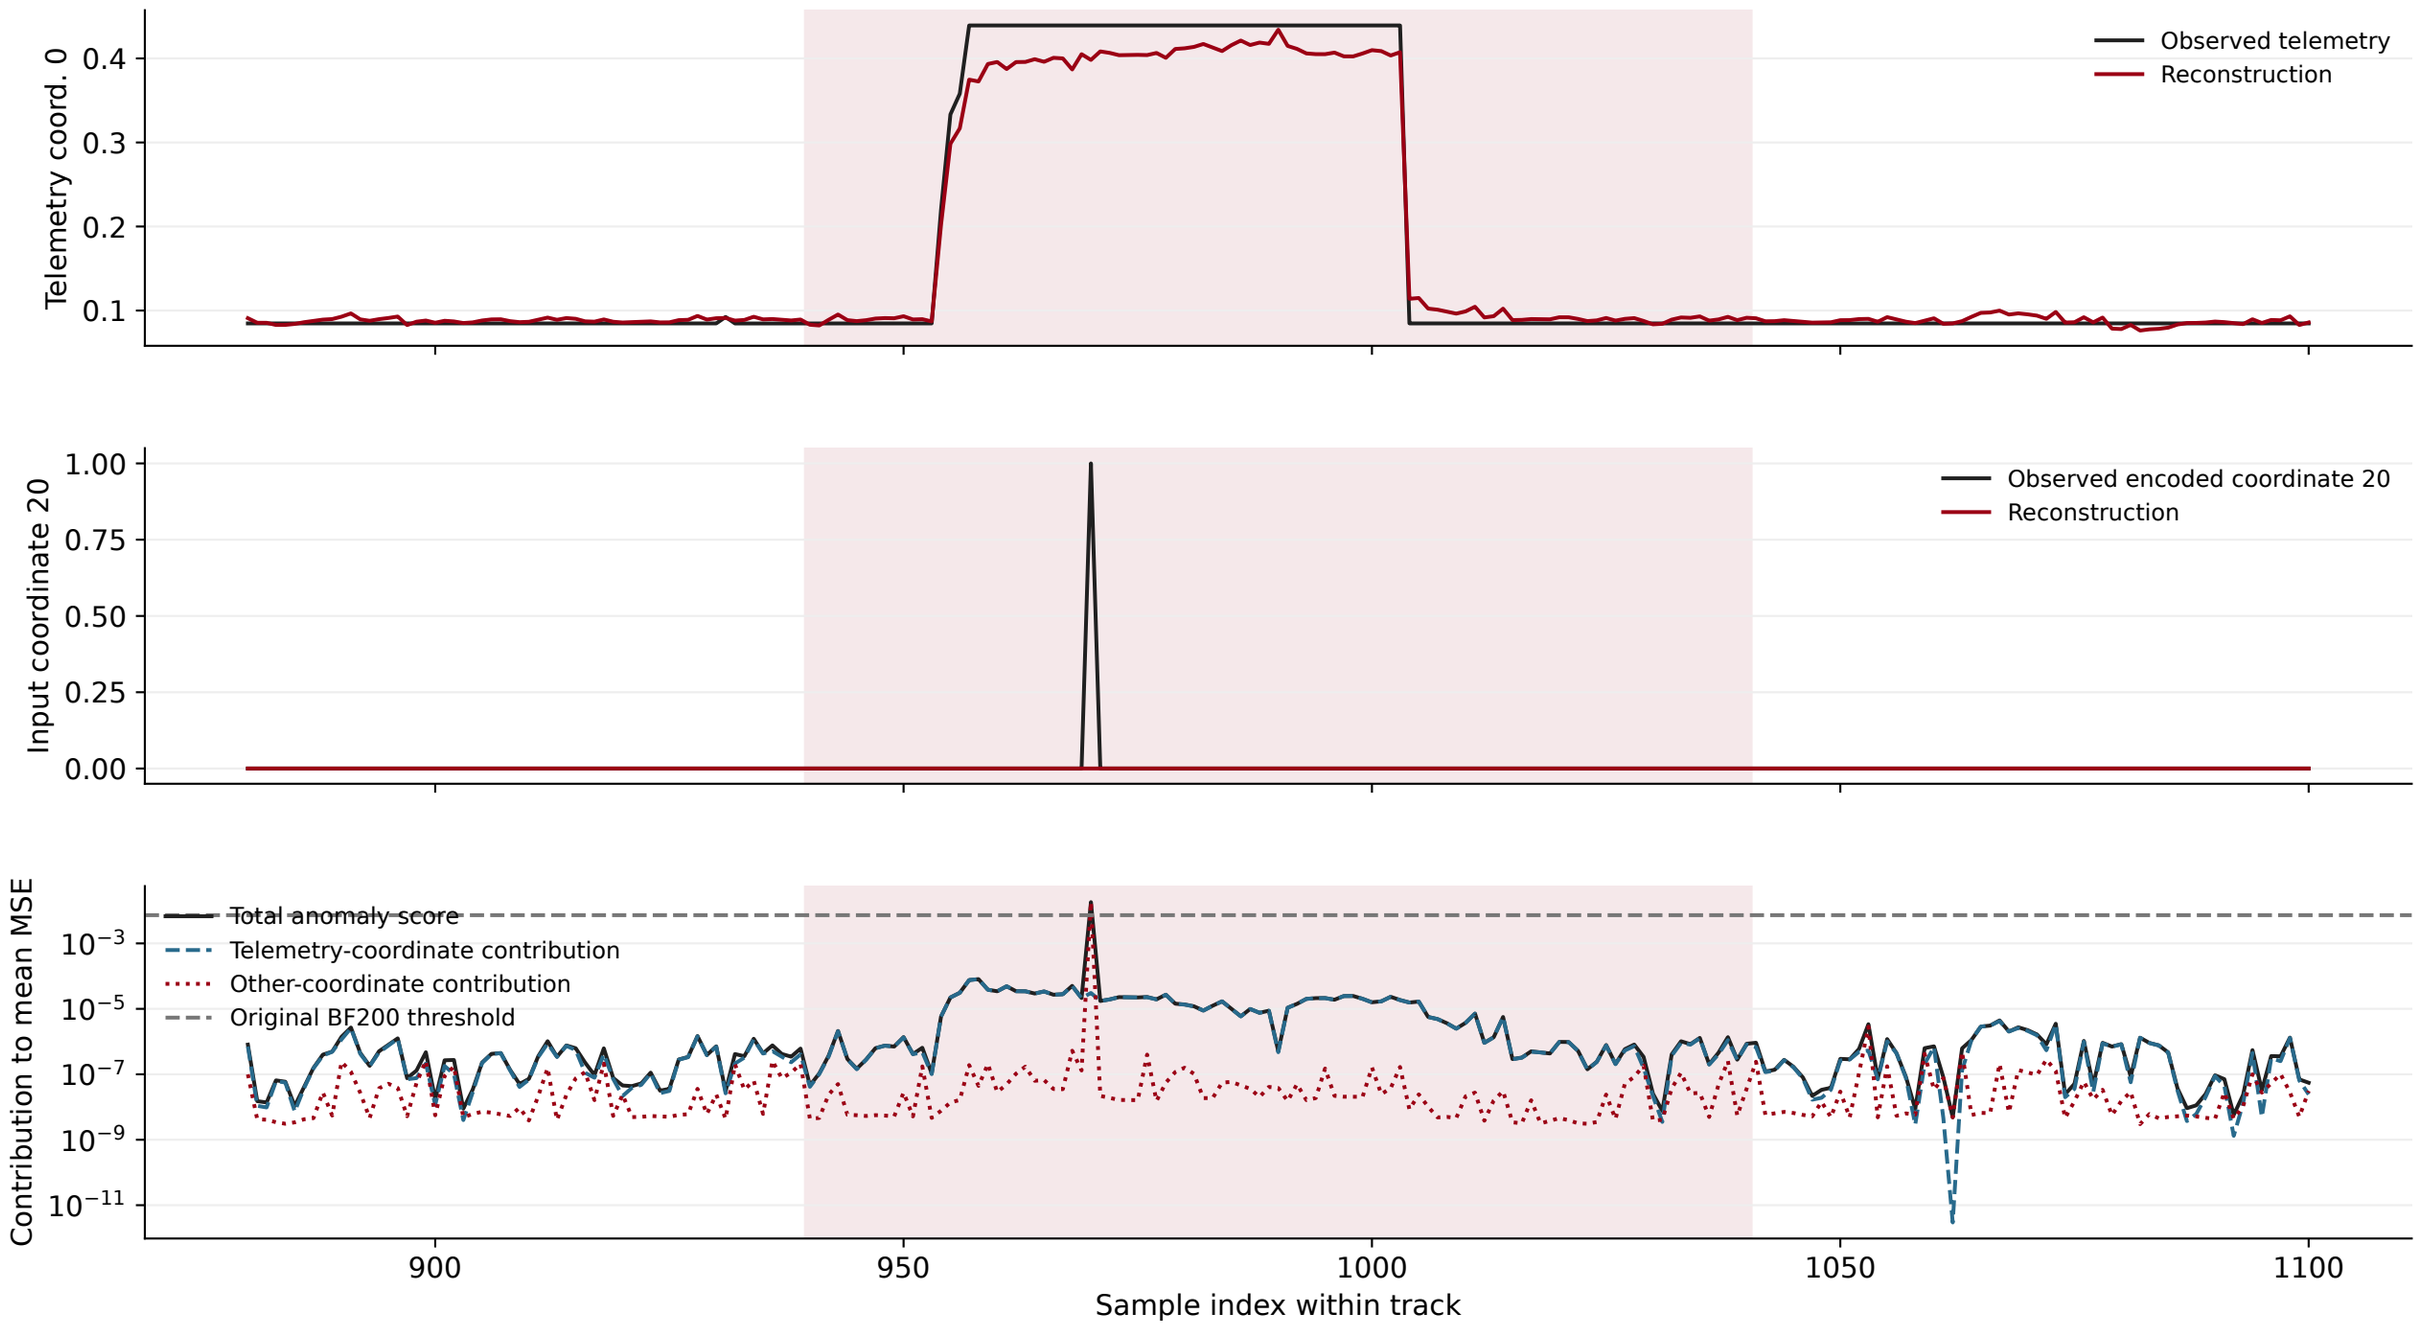


Entire MSL test stream, alpha 0.65: PA F1 40.71% -> 84.97% | raw F1 5.74% -> 15.41%

Continuous-score ROC-AUC is unchanged: 61.00%. BF200 first grid step: 0.00748833.

MSL / M-7: which input creates the BF200 alarm?

W25 / FF110; original BF200 alpha=0.0. Coordinate 0 is the telemetry; others encode command-related inputs.



At sample 970, telemetry contributes 0.17% of the score; other coordinates contribute 99.83%.

This alarm lies inside the annotated event. Its feature contribution does not identify a physical command fault or prove that it is spurious.
