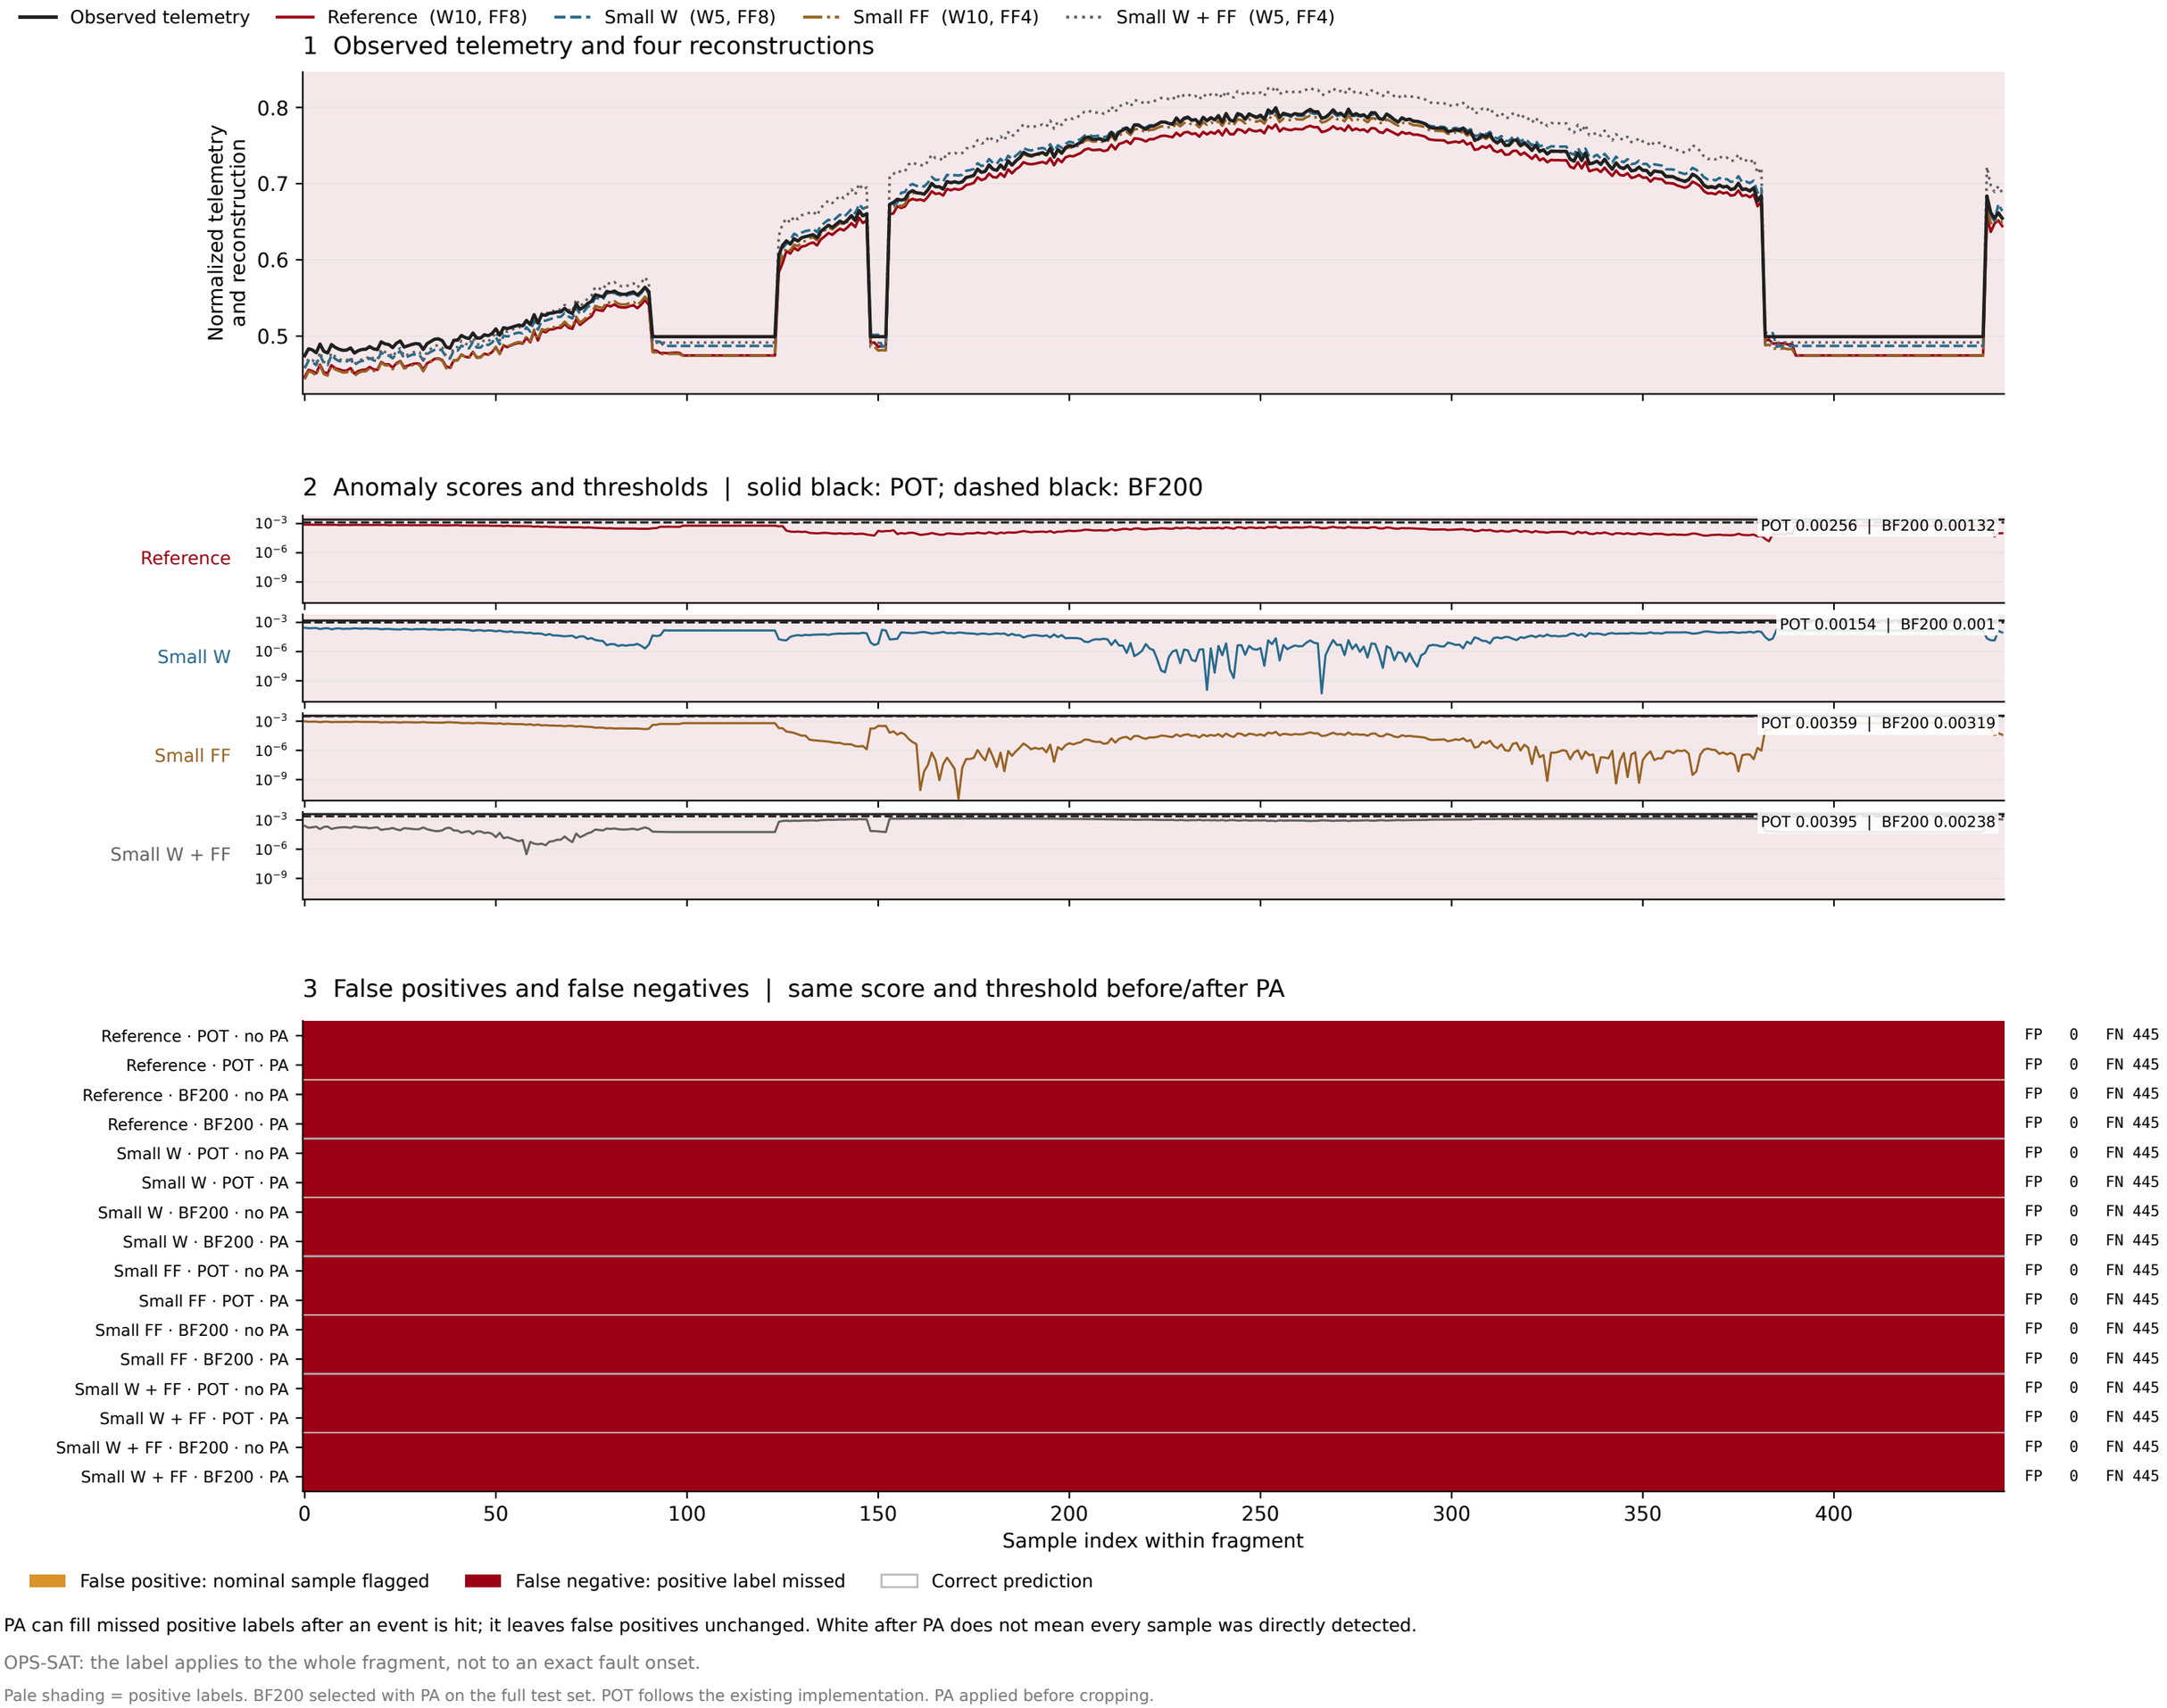
OPS-SAT | 239 | Anomalous fragment

TranAD+ architecture throughout | seed 2026 | 50 epochs | fixed alpha = 0.5



PA can fill missed positive labels after an event is hit; it leaves false positives unchanged. White after PA does not mean every sample was directly detected.

OPS-SAT: the label applies to the whole fragment, not to an exact fault onset.

Pale shading = positive labels. BF200 selected with PA on the full test set. POT follows the existing implementation. PA applied before cropping.
